

Peer Review of *Prototyping a Weather Radar Foundation Model Using Self-Supervised Transformers* by Daniel Wefer

- Content
 - Daniel's project was very well thought out and executed well. The presentation demonstrated a clear focus in how it went about using self-supervised learning to classify different storm types.
- Organization
 - The flow of the poster was very logical and easy to follow without making any large jumps where it felt like I was missing something significant.
- Visual Aids
 - The presentation was full of large figures that displayed how the project went about reaching its end goal. The text boxes were used effectively to convey exactly what was meaningful about the figures.
- Preparation
 - Daniel was very comfortable with this project and the way he spoke conveyed an expertise only someone that had been practicing could achieve.
- Audience Sensitivity
 - Due to the style of poster presentation, Daniel gave a lot of time for the audience to ask questions and engage with the project. They managed to answer the questions as though they were expected and put a lot of thought into how to answer the questions for any kind of audience.
